Education

Instituto Tecnológico Superior de Lerdo
Ingeniería en Sistemas Computacionales
2020 - 2024

Skills

Technical Skills

- PHP, JavaScript, TypeScript, Python, C#, .NET, Node.js
- Laravel, CodeIgniter, Vue.js, React
- MySQL, PostgreSQL, MongoDB
- REST APIs, ERP Systems, Backend Development
- Unit Testing, Integration Testing

Languages

- Spanish (Native)
- English (Intermediate)

Jesús García

Full Stack Developer | ERP Systems | Backend & Database Optimization

Full-Stack Software Developer with experience designing and developing ERP systems, enterprise web applications, and scalable backend solutions. Proficient in building end-to-end software products, optimizing databases, developing RESTful APIs, and implementing complex business logic. Passionate about software architecture, performance optimization, and AI-powered automation. Currently expanding expertise in artificial intelligence, workflow automation, and modern web technologies.

Open to remote, hybrid, and relocation opportunities.

Work Experience

Evidence Technology – Web Developer (Backend | Full Stack | ERP Systems)

March 2025 – June 2026

- Developed and implemented ERP modules and enterprise web applications with complex business logic in a full-stack environment.
- Participated in requirements analysis, technical design, development, integration, and maintenance of critical functionalities across multiple system modules.
- Developed APIs, backend services, and business processes using PHP, .NET, Node.js, and Python, ensuring seamless integration between systems and components.
- Built frontend interfaces and reusable components with JavaScript, TypeScript, and Vue.js, focused on user experience and operational efficiency.
- Designed, managed, and optimized relational databases, including complex SQL queries, stored procedures, and performance improvements.
- Integrated internal and external services, automated business processes, and developed tools to improve operational workflows.
- Refactored and modernized legacy code to enhance application scalability, maintainability, and reliability.
- Implemented unit and functional testing to ensure software quality and enable early detection and resolution of issues.
- Identified and resolved performance bottlenecks in backend processes and SQL queries, improving overall system efficiency.
- Participated in deployments, corrective and enhancement maintenance, incident resolution, and continuous improvement of production systems.

CFE – Software Development Intern (Backend | Full Stack | ERP Systems)

May 2024 – November 2024

- Developed a full-stack employee evaluation system for temporary CFE personnel, participating in all stages of the software development lifecycle.
- Designed and modeled relational databases, developed APIs, and implemented business logic using CodeIgniter.
- Built dynamic user interfaces with Vue.js and integrated frontend and backend components through API consumption.
- Implemented features for employee evaluation, tracking, and personnel management, streamlining internal processes and workflows.
- Optimized SQL queries, automated email notification systems, and improved overall application performance and responsiveness.
- Conducted functional testing, resolved software defects, and provided ongoing maintenance and enhancements to ensure system reliability.

Projects

Custom ERP System – Furniture Business (Freelance Project)

Description:

- Design, development, and implementation of a custom ERP and Point of Sale (POS) system from scratch. The system digitizes and centralizes the entire business operation, including lead management (CRM), quotations, dynamic inventory control with product design variations, custom manufacturing process tracking, shipping and delivery logistics, human resources administration (attendance, employee loans, and weekly payroll), and real-time financial profitability analysis.
- Full-Stack Architecture: Designed and implemented the complete platform using React for the frontend and FastAPI for a high-performance asynchronous backend.
- Pricing Engine: Developed an algorithm that automates final price calculations based on manufacturing costs, shipping expenses, product dimensions, profit margins, and logistics costs.
- Financial Allocation Algorithm ("Bags"): Created a financial system that allocates revenue across operational expenses, banking fees, and taxes to calculate the actual net profit per order.
- CRM & Marketing Campaigns: Developed a CRM module with a sales pipeline and Return on Investment (ROI) tracking for advertising campaigns across Facebook, Instagram, WhatsApp, and TikTok.
- Payroll & Attendance Management: Automated human resources operations through weekly attendance tracking, employee loans/advances, and payroll calculations including overtime and deductions.
- Logistics: Designed a delivery scheduling calendar and a freight quotation system integrated with postal code databases and regional shipping rates.
- Security (RBAC): Implemented Role-Based Access Control (RBAC) with modular permissions for business owners, administrators, and sales representatives.
- Deployment & Infrastructure: Orchestrated the cloud architecture using Vercel, Render, and Aiven MySQL, and implemented secure Git workflows with production branch protection.
- PDF Export Automation: Developed automated PDF generation for quotations, payroll receipts, and system operation manuals using WeasyPrint and ReportLab.

AI Chatbot – Personal Project

Description:

- Developed an AI-powered chatbot for automating conversations and handling user inquiries.
- Integrated Large Language Model (LLM) APIs to generate dynamic, context-aware responses.
- Developed backend logic, conversation management workflows, and REST API communication for seamless interaction between services.
- Implemented features focused on improving user experience, automating processes, and enhancing conversational efficiency.
